# Table of contents

- 1 Anomalies
- 2 Anomal(ous symmetr)ies of three-dimensional TQFTs
- 3 Future directions
- 4 (If time allows:) Higher projective symmetries

# Anomalies

- **TQFT** = fully-extended symmetric-monoidal functor  $\mathbf{Bord}_d^{\text{fr}} \rightarrow \mathcal{T}$ .
- **Relative/twisted/boundary theory** is a (lax) natural transformation<sup>1</sup>  $F: 1 \rightarrow \beta$  (or  $\beta \rightarrow 1$ ).
- An **anomaly**<sup>2</sup> is an invertible once-categorified  $d$ -dimensional TQFT  $\alpha$ , and an anomalous  $d$ -dimensional TQFT is a relative theory  $F: \alpha \rightarrow 1$ .

## Example

Let  $V$  be a finite-dimensional vector space.

- $V$  classifies a TQFT  $\mathbf{Bord}_1^{\text{fr}} \rightarrow \mathbf{Vect}$ .
- $G \rightarrow \text{GL}(V)$  classifies a TQFT  $\mathbf{Bord}_1^{BG} \rightarrow \mathbf{Vect}$ .
- $G \rightarrow \text{PGL}(V)$  classifies an anomalous 1-d TQFT on  $\mathbf{Bord}_1^{BG}$ .

# Anomal(ous symmetr)ies of three-dimensional TQFTs

Building on existing results<sup>3,4</sup> I introduce:<sup>5</sup>  $B^2\mu_q \hookrightarrow 3\text{Pin} \twoheadrightarrow \mathcal{O}(L \oplus L^\vee)$ .

## Theorem (VD<sup>5</sup>)

*The framed Dijkgraaf-Witten theory for a finite abelian group  $L$  canonically defines the following, which are equivalent:*

- a symmetric-monoidal functor  $\mathbf{Bord}_3^{B\,3\text{Pin}(L \oplus L^*, \text{ev})} \rightarrow \mathbf{Fus}$
- an anomalous theory on  $\mathbf{Bord}_3^{B\,\mathcal{O}(L \oplus L^*)}$
- $\mathcal{O}$  acts via “twice-categorified integral transforms”<sup>6</sup>.
- We can replace  $\mathcal{O}$  with the 2-group  $\text{Aut}_{\mathbf{EqBr}} \sigma_{BL}^3(S^1)$ , and then a certain “level” controls the non-triviality of the anomaly<sup>5</sup>.

1-dimensional	3-dimensional
$(V, q)$	$(A, q)$
$SO(V, q) \subset O(V, q)$	$SO(A, q) \subset O(A, q)$
$\mathbf{k}^\times$	$B^2\mathbf{k}^\times$
$\text{Cliff}(V)$	$\mathcal{A} = (\mathbf{Vect}[A], *, \beta_q)$
$\{x, y\} = b_q(x, y)$	$\beta_q: \mathbf{k}_a * \mathbf{k}_b \xrightarrow{b_q(a,b) \text{ id}} \mathbf{k}_b * \mathbf{k}_a$
$V \rtimes O(V, q)$	$\text{Aut}_{\mathbf{EqBr}}(\mathcal{A})$
$\text{Pin}(V, q)$	$3\text{Pin}(A, q)$
$\text{Spin}(V, q)$	$3\text{Spin}(A, q)$
$V \simeq L \oplus L^*$	$A \simeq L \oplus L^*$
$\wedge^\bullet L^*$	$\mathcal{C} = (\mathbf{Vect}[L^*], *)$
$\text{End}(\wedge^\bullet L^*) \simeq \text{Cliff}$	$\text{Aut}_{\mathbf{Fus}}(\mathcal{C}) \simeq \text{Pic}(\mathcal{A})$

# Future directions

- Analogous results for fusion 2-categories<sup>7</sup>?
- $\mathbb{P}\mathbf{Fus}$  replaced with the projectivization of the  $(\infty, n + m + 2)$ -category  $\mathbf{Alg}_n(m\mathbf{Pr}^L)$  á la JFS<sup>1</sup>?
- Gapped systems, topological phases of matter
- Non-semisimple finite ribbon categories
  - Link and manifold invariants<sup>8</sup>
  - Rozansky-Witten theory and relative Langlands

## Conjecture

*The truncation of  $\mathrm{Aut}(\mathbf{RW}_M(*))$  to a group is  $\mathrm{Sp}(M)$ .*

**Rmk:** The  $k$ -invariant of  $B\mathrm{Aut}$  in  $H^4(B\mathrm{Sp}(M), \mathbb{C}^\times)$  would then be the projectivity/anomaly of the action  $\mathrm{Sp}(M) \curvearrowright \mathbf{RW}_M$ .

# Higher projective symmetries

In Theorem C.16<sup>5</sup>, I relate twisted quantization<sup>9</sup> with anomalies:

## Theorem (VD<sup>3</sup>)

$$\alpha_c \rightarrow 1 \quad \Longleftrightarrow \quad 1 \rightarrow \sigma_{X,c}^{d+1}$$

E.g.      (projective) group rep.      mod. / (twisted) group alg.

Given a **trivialization**, they will reduce to (the same)  $X$ -theories:

$$1 \xrightarrow{\sim} \alpha_c \xrightarrow{F_\alpha} 1$$

$F_X$

$$1 \longrightarrow \sigma_{X,c}^{d+1} \xrightarrow{\quad} \sigma_X^{d+1}$$

$F_X$
